PERSIA'S RAD RIDES

AI Insurance Intake

Third-Party Vendor Constraints vs In-House AI Workflows

A working prototype demonstrating how schema-enforced validation, real-time security, and conversational UX eliminate the friction points identified in third-party vendor intake systems.

Prototype walkthrough aligned to 9 key insight areas

Table of Contents

Third-Party Vendor Insight: Vendor Constraints vs In-House AI Workflows

1

Vendor Constraints in Current Intake Workflows

Systemic limitations in third-party platforms

2

Problem Signals Identified in Existing Processes

Low data pull success & upload friction

3

Observed User and Operational Friction

User anxiety & high cognitive load

4

Third-Party Solutions: Structural Rigidity

Inflexible workflows & slow adjustment

5

Security & Data Integrity Risks from Late-Stage Validation

Cross-claim contamination exposure

6

Why In-House Insight Layers Reduce Friction

Faster feedback loops & less dependency

7

Case Studies: In-House Control vs Vendor Dependency

Improved accuracy & governance

8

Contextualized Engineering: Persia's Rad Rides Example

Schema validation eliminates invalid inputs

9

Strategic Takeaways for Third-Party Vendor

Early validation = lower risk, higher control

Progress bar with 9 steps: 1. Name (checked), 2. DOB (active), 3. Claim, 4. Method, 5. Carrier, 6. Policy, 7. Collision, 8. Comp, 9. VIN

The Problem

Vendor Constraints in Current Intake Workflows

- Third-party vendors lock teams into rigid intake flows with no room for customization.
- Early error propagation and throughput delays compound at every stage.
- Our prototype shows a clean, guided entry point — step 1 starts immediately with full context.

The chatbot launches with a single clear prompt — no fragmented forms, no dead ends.

Progress bar with 9 steps: Name, DOB, Claim, Method, Carrier (active), Policy, Collision, Comp, VIN.

✓ Perfect! Now, please provide your date of birth (MM/DD/YYYY).

✓ Perfect! Now, please provide your Persia's Rad Rides claim number (6 digits only).

✓ Perfect! Now, please provide your how you want to provide insurance information.

✓ Perfect! Now, please select your insurance carrier.

Diagnosing Friction

Problem Signals Identified in Existing Processes

- Low data pull success rates signal that upstream validation is missing or too late.
- Upload friction creates drop-off when users can't confirm what's needed.
- Our prototype offers both manual and upload paths — user chooses, system validates either way.

Claim number collected early (step 3) and upload method chosen immediately after — zero ambiguity.

Progress bar with 9 steps: Name, DOB, Claim, Method, Carrier, Policy (6), Collision (7), Comp (8), VIN (9). Steps 1-5 are completed (green checkmarks). Step 6 is active (pink circle with 6). Steps 7-9 are pending (grey circles with numbers).

✓ Perfect! Now, please provide your how you want to provide insurance information.

manual

✓ Perfect! Now, please select your insurance carrier.

Reducing Cognitive Load

Observed User and Operational Friction

- Fragmented systems force users to context-switch between forms, documents, and portals.
- High cognitive load leads to errors, abandonment, and rework downstream.
- Conversational flow + dropdown constraints keep the user focused on one thing at a time.

Carrier selection uses a curated dropdown — no free-text guessing, no typos, no ambiguity.

Progress bar with 9 steps: Name, DOB, Claim, Method, Carrier, Policy, Collision, Comp, VIN. Steps 1-7 are completed (green checkmarks). Step 8 (Comp) is active (pink circle with 8). Step 9 (VIN) is pending (grey circle with 9).

✓ Perfect! Now, please provide your insurance policy number.

....

✗ Policy number seems too short. Please verify and re-enter

Please try again.

.....

✓ Perfect! Now, please provide your whether you have collision coverage.

yes

✓ Perfect! Now, please select your collision deductible amount.

Why Vendors Can't Adapt

Third-Party Solutions: Structural Rigidity

- Vendor workflows are built for generic use — they can't match specific data needs.
- Slow adjustment cycles mean fixes lag behind operational changes.
- Our prototype enforces policy number length in real-time — invalid entries never pass through.

Real-time validation catches short policy numbers before they propagate — no late-stage cleanup.

Protecting PII at Input

Security & Data Integrity Risks from Late-Stage Validation

- Late-stage validation leaves PII exposed longer than necessary.
- Cross-claim contamination risk increases when data isn't isolated at the source.
- DOB and policy number are masked on entry with a Show/Hide toggle for user verification.

Password-style masking + 'Secured' badge ensures sensitive data is protected the moment it's typed.

Progress bar with 9 steps: Name, DOB, Claim, Method (4), Carrier (5), Policy (6), Collision (7), Comp (8), VIN (9). Steps 1-3 are completed (green checkmarks). Step 4 is the current step (pink circle with number 4). Steps 5-9 are pending (grey circles with numbers).

Hi! I'll help collect your insurance info for your Persia's Rad Rides claim. Let's start with your full name as it appears on your insurance policy.

Faster Feedback, Less Dependency

Why In-House Insight Layers Reduce Friction

- Internal systems can adapt validation rules without waiting on vendor release cycles.
- Show/Hide toggle gives users control — verify before submitting, no guesswork.
- Tighter feedback loops mean errors are caught and corrected in seconds, not days.

The 'Show' toggle lets users confirm their DOB before proceeding — trust built into the flow.

Progress bar with 9 steps: Name, DOB, Claim, Method, Carrier, Policy, Collision, Comp, VIN. Steps 1-7 are completed (green checkmarks). Step 8 (Comp) is the current step (pink circle with 8). Step 9 (VIN) is pending (grey circle with 9).

✓ Perfect! Now, please provide your insurance policy number.

Collision & Comprehensive Coverage

Case Studies: In-House Control vs Vendor Dependency

- Vendor systems often bundle coverage questions — users get lost in long generic forms.
- In-house control allows smart skip logic: say 'no' to collision, skip the deductible entirely.
- Deductible dropdowns constrain choices to valid amounts — no free-text errors.

Smart skip logic + constrained dropdowns = zero junk data for coverage fields.

Review Your Information

Please verify all information is accurate before submitting.

Full Name:	Dee W
Date of Birth:	07/07/1982
Claim Number:	234987
Data Entry Method:	manual
Insurance Carrier:	State Farm
Policy Number:	1245kckcldksdac
Collision Coverage:	yes
Collision Deductible:	\$500
Comprehensive Coverage:	yes
Comprehensive Deductible:	\$1000
VIN:	1HGBH41JXMN123456

☒ I verify that all the information provided above is accurate and complete. I understand that providing false information may negatively affect the processing time of your claim.

Submit Insurance Information

Persia's Rad Rides Example

Contextualized Engineering: Preventing Junk Data

- Schema enforcement at the source means invalid data never enters the pipeline.
- Every field is validated before the user advances — no batch-processing surprises.
- The full review screen shows all collected data side-by-side before final submission.

11 fields, all validated in real-time. The review screen is the final gate — clean data, guaranteed.

✓ Excellent! All information collected. Please review below and submit when ready.

Submission Successful!
Your insurance information has been securely received and validated.

Confirmation Number
PRR-722870

Send confirmation to:

Email Text

Next Steps:

- Your claim will be processed within 24-48 hours
- You'll receive updates via email and SMS
- No cross-contamination detected - data securely stored
- Contact support if you have questions: support@persiaradrides.com

Confirmation & Next Steps

Strategic Takeaways for Third-Party Vendor

- Early validation reduces rework, lowers risk, and increases throughput across the board.
- Internal insight layers give full control over intake quality and user experience.
- Confirmation number + email/text delivery closes the loop — user knows their claim is received.

 **From first input to confirmation: a complete, zero-contamination intake in under 2 minutes.**

The Path Forward

Schema-enforced validation at source eliminates junk data before it enters the pipeline.

Real-time security (masking + toggle) protects PII the moment it's entered.

Conversational UX reduces cognitive load and abandonment at every step.

Smart skip logic and constrained dropdowns enforce data integrity passively.

Full review + confirmation closes the loop — users trust the process.

In-house AI control isn't the future — it's the fix.

The screenshot displays the 'AI Insurance Intake' form for 'PERSIA'S RAD RIDES'. The form is titled 'Schema-Enforced Validation • Zero Cross-Contamination'. A progress bar at the top shows steps: Name, DOB, Claim, Method, Carrier, Policy, Collision, Comp, and VIN, all marked with green checkmarks. Below the progress bar, a red error message 'Please try again.' is visible. A pink button displays the VIN '1HGBH41JXMN123456'. A green message box states '✓ Excellent! All information collected. Please review below and submit when ready.' The main content area features a large green checkmark icon and the text 'Submission Successful! Your insurance information has been securely received and validated.' Below this, a white box displays the 'Confirmation Number PRR-722870'. A section titled 'Send confirmation to:' includes two buttons: 'Email' (pink) and 'Text' (green). A 'Next Steps' section lists: 'Your claim will be processed within 24-48 hours', 'You'll receive updates via email and SMS', 'No cross-contamination detected - data securely stored', and 'Contact support if you have questions: support@persiasradrides.com'. A small inset image of a smartphone is visible in the bottom right corner.
